Mask vs. Mirror

Somatic Floor & Regulation Protocol

A COMPANION TO THE ARCHITECTURE OF GRACE · BOOK 3 · UNIT 1 · LESSON 1

SECULAR · CLINICAL DOCUMENT

This document contains no religious content. It addresses only the physiological, regulation, and clinical-floor dimensions of U1·L1. It may be used in any school setting — public, private secular, parochial, or independent — without modification. Establishment Clause compliant.

Grades 6–8 · Middle School

Trauma-Informed · Window of Tolerance · Mandatory Reporting Aware

The body keeps the score. The body also tells the truth before the mouth catches up.

What This Document Is · And What It Isn't

This is the somatic floor under U1·L1 (The Mask vs. The Mirror) of The Architecture of Grace · Book 3 · The Interior. It is fully secular, fully clinical, and fully deployable. It governs how teachers monitor

regulation during the lesson, how disclosures are handled, and what the body-level accommodations look like for students with IEP, 504, ELL, or autism-spectrum needs.

WHAT THIS DOCUMENT IS

- A teacher-facing pre-lesson, mid-lesson, and post-lesson regulation protocol for U1·L1.
- A reference for recognizing when the body's signals are telling you something different than the student's words are telling you.
- An accommodations matrix tying U1·L1 delivery to IEP, 504, ELL, and autism-spectrum supports.
- A disclosure pathway aligned to Section 4.5 of the Book 3 master document — what to do when something surfaces.
- A compatibility map showing how this document plugs into the master curriculum without modifying it.

WHAT THIS DOCUMENT IS NOT

- It is not a Christian companion. There is a separate document (D2) that handles the doctrinal extension for schools using the Divine Blueprint track. This document does not reference scripture and does not assume any religious frame.
- It is not a clinical assessment tool. The regulation cues here are observational. They do not replace counselor or clinical evaluation.
- It is not a script for the master lesson. The master U1-L1 lesson in the Book 3 curriculum remains the lesson. This document sits underneath it.
- It is not optional. The somatic floor is the clinical floor. The master lesson cannot be delivered safely without it.

ONE OPERATIONAL FACT

Book 3's Legal & Clinical Compliance section is at Section 4.5 (not 4.6 like Book 2). Every reference in this document to disclosure protocols, mandatory reporting, AFSP Safe Messaging, PPRA, and counselor coordination points to Section 4.5 of the master Book 3 document. If you are operating from a print master that does not match this numbering, verify against the digital master before delivering the lesson.

The Body's Relationship to Public Self-Presentation

U1-L1 introduces a developmental construct — the Mask versus the Mirror — that asks middle schoolers to examine the gap between what they show in public and what is true inside. That examination is not a purely cognitive exercise. The body is involved. Before a student can name the gap verbally, the body has usually already registered it.

Three developmental facts shape how this lesson lands in the nervous system of a Grade 6–8 student:

1. THE ADOLESCENT BODY IS REORGANIZING

Between ages 11 and 14, the adolescent autonomic nervous system goes through significant recalibration. Baseline arousal levels rise. Sympathetic responsiveness (fight/flight) becomes more sensitive. The prefrontal cortex — the seat of self-monitoring, impulse control, and self-narrative coherence — is in active development and is intermittently online. This means that even small interior conflicts can produce surprisingly large physiological responses. A Grade 7 student who looks like they are sitting quietly during U1-L1 may be in significant sympathetic activation that they cannot themselves accurately describe.

2. MASK-WEARING IS METABOLICALLY EXPENSIVE

Maintaining a public persona that diverges from interior experience costs energy. Research in identity authenticity (Harter, 2012; Schlegel & Hicks, 2011) consistently finds that the gap between self-presentation and self-experience is associated with elevated cortisol, reduced executive function, and disrupted sleep. The Mask is not free. Middle schoolers, many of whom have been performing Masks for years already, often arrive at U1-L1 already in low-grade chronic activation. The lesson does not create that activation. It names it.

3. NAMING THE GAP CAN BRIEFLY INCREASE ACTIVATION BEFORE IT DECREASES

This is the central clinical fact for U1·L1. When students first articulate, in a journal or out loud, the distance between what they show and what is true, their bodies typically register a brief spike in arousal — sometimes accompanied by tears, sometimes by laughter, sometimes by withdrawal, sometimes by a brief moment of stillness that adults misread as disengagement. This is a regulation event, not a pathology. The arousal will settle on its own within the lesson if the teacher does not interrupt it or amplify it. The somatic protocol below is designed to support that natural settling.

WHAT THIS MEANS FOR DELIVERY

Expect higher baseline activation in the room during U1·L1 than during a typical academic lesson. This is normal and does not indicate a problem with the lesson. Expect brief spike-and-settle events during the journal segment. These are regulation working, not failing. Do not interrupt them. Watch for students whose activation does NOT settle — the protocol below provides what to do. The body's signals will sometimes contradict the student's verbal report. The body is more reliable. Always weight the body.

Window of Tolerance · Middle School Refresher

The Window of Tolerance (WoT) — Dan Siegel's framework for the zone of arousal in which learning, processing, and self-regulation can occur — is the operational construct underneath every Book 3 lesson. This is a refresher for U1·L1 specifically, calibrated to what the lesson asks of students.

INSIDE THE WINDOW · Regulated	Engaged but settled. Eye contact present (or appropriately averted per student baseline). Breathing visible and easy. Writing or attending. Can answer or pass on a prompt without distress. May be emotional — emotion is not the same as dysregulation.	Proceed with the lesson as planned. This is the target state.
UPPER EDGE · Activated but in-window	Increased fidgeting, faster breathing, flushed face, tearfulness without collapse, brief withdrawal then return. The student is processing something real. This is not yet dysregulation — it's the activation a regulation event produces.	Allow the natural settling. Do not interrupt unless it escalates. Keep the room calm. Lower your voice slightly. Pacing slows.
HYPERAROUSAL · Outside the window (sympathetic)	Visible agitation, inability to settle, racing speech or shutdown of speech, hands trembling, sudden anger, request to leave, escalation to crying that doesn't self-resolve in 60–90 seconds.	Stop the academic content. Move to grounding (see protocol below). If grounding does not bring the student in-window within 2 minutes, escort to counselor under Section 4.5.
HYPOAROUSAL · Outside the window (parasympathetic shutdown)	Flat affect that wasn't present at lesson start, head down for an extended period, slumped posture that develops mid-lesson, non-responsive to gentle check-ins, glazed eyes. EASILY MISSED. Often misread as "tired" or "bored."	Same protocol as hyperarousal: stop academic content, move to grounding. Hypoarousal is the easier state to misread and the more important one to catch.

THE HYPOAROUSAL POINT

Hypoarousal is the easier state to miss. A student who has shut down quietly does not interrupt the lesson the way a student who is escalating does. They will be the student who appears to be cooperating — head slightly down, no questions, no resistance. They are not cooperating. They are gone. Train yourself to scan for the quiet ones. Set a midpoint reminder for yourself to do a deliberate sweep. The hypoaroused student is the one this protocol exists to catch.

Pre-Lesson Somatic Check · Teacher Side

The somatic floor begins before the lesson begins. The teacher's own regulation is the room's regulation. A teacher who arrives in their own activated state will deliver a lesson that activates the room. This is not optional self-awareness. It is a clinical fact about middle schoolers, who track adult nervous-system state with extreme accuracy whether they verbalize it or not.

FIVE MINUTES BEFORE STUDENTS ARRIVE

- Sit at your desk. Phone off the table. Door closed if possible.
- Three slow exhales — slower than inhales. This deliberately activates the parasympathetic system.
- Feel your feet on the floor. Notice the chair holding your weight. This is grounding, not metaphor — it is shifting your awareness from cognition to body.
- Read the lesson's opening sentences one more time. Out loud if alone. Notice the pace and tone.
- Name to yourself: this is a threshold lesson. The students do not yet know what the year will do. I am the one who knows. I get to set the tone.

PRE-LESSON RED FLAGS · POSTPONE IF ANY OF THESE ARE TRUE

Some days are not the right day to teach U1·L1. If any of the following is true, postpone the lesson. The master pacing calendar allows for one full week of flexibility around U1·L1.

- You are yourself outside your own Window of Tolerance — recent significant stressor, illness, sleep deprivation, acute family event.
- The class has just come from a significantly activating event (lockdown drill, fight in the hallway, major disciplinary event, news of a community loss).
- A student known to be in crisis is unexpectedly absent or unexpectedly present in a way that requires your attention.
- The counselor is unavailable for the entire day and cannot be reached by phone. (For U1·L1, counselor availability by phone is sufficient. For ★★ lessons later in the year, on-site is required.)
- The substitute is delivering the lesson without having read this somatic floor document. Threshold lessons do not run with substitutes. Postpone.

THE POSTPONEMENT PRINCIPLE

Postponing U1·L1 by a day or a week is not a failure. The threshold lesson is best delivered when the room is settled, the teacher is regulated, and the support structure is in place. The curriculum was designed with this flexibility built in. The lesson will be better delivered with one week's delay than rushed delivered today.

What you cannot do is skip the somatic floor and deliver the lesson anyway. The floor is not a recommendation. It is the floor.

Mid-Lesson Somatic Monitoring · The In-Lesson Scan

U1·L1 includes the curriculum's mandatory In-Lesson Scan — a 10-second pause at specified points during the lesson where the teacher does a deliberate room sweep before continuing. This document specifies the scan points for U1·L1 and what to look for at each.

After the opening ritual (≈ 3 min in)	The class has just done the 2–4 minute grounding ritual that opens every Book 3 lesson. Before introducing the Mask/Mirror construct, pause.	Whose body language is still activated despite the ritual? Whose breathing is visibly elevated? Who avoided the ritual entirely? Note these students. They are your highest-priority scans for the remainder of the lesson.
After the construct is introduced (≈ 8 min in)	You have just named the Mask and the Mirror as a structural distinction. Students have heard the words for the first time. Pause for 10 seconds before moving to examples.	Who froze when you named it? Who looked away? Whose eyes filled? Whose body got smaller? The lesson's emotional weight first lands here. The students who are most affected by the construct will signal it now.
Just before the journal prompt (≈ 18 min in)	You are about to ask students to write something honest in their private journal. Pause. Restate the privacy frame. Then scan.	Who is reluctant to open their journal? Who has gone visibly quiet? Who has moved their chair back from the table? Journal time is when the lesson's deepest activation surfaces. Adjust your physical proximity to be near (not over) any student who has signaled.
Mid-journal (≈ 24 min in)	Students have been writing for 5–6 minutes. You are not reading what they write — but you ARE scanning the room with care.	Hypoarousal point. Heads down too long? Pen not moving for an extended period? Tears (with or without writing)? Any of these are normal. None of them is automatically a referral. Note. Continue scanning.
At the close (≈ 32 min in)	You are about to wrap. Students close journals. Do the final scan before transition.	Who needs more time before transitioning to the next class? Who needs to be the first person you check in with at the door? Any student you have noted at three or more scan points gets a brief, private end-of-class check-in: 'That was a lot today. Are you okay?'

ON THE 'BRIEF, PRIVATE END-OF-CLASS CHECK-IN'

When a student has signaled at three or more scan points, the protocol is a brief check-in at the door as they leave. Not a sit-down. Not a meeting. Not a referral on its own. Just: 'That was a lot today. Are you okay?' If the student says yes, accept it. Note it in your teacher log. Watch them tomorrow. If the student says no, or says something concerning, or breaks down, you now have a referral. Section 4.5 disclosure protocol applies. Counselor handoff. The check-in is brief precisely so it is not an interrogation. Middle schoolers will tell you more in 30 seconds at the door than in 30 minutes in a meeting.

When Grounding Is Needed · The Protocol

If a student moves out of the Window of Tolerance during U1-L1 — into either hyperarousal or hypoarousal — the academic content stops and grounding begins. This is the 2-minute protocol. It is the same protocol used throughout Book 3; familiarity makes it deployable.

THE 2-MINUTE GROUNDING PROTOCOL

1. **STOP THE LESSON.** The class can wait. Or — preferably — give the class a 2-minute silent task (re-read the journal prompt, do a private breath count) while you work with the student.
2. **APPROACH SLOWLY AND LOW.** Crouch or kneel near the student so your face is at or below their eye level. Do NOT loom. Adolescents read looming as threat even when you are trying to be kind.
3. **NAME WHAT YOU SEE, IN ONE SHORT SENTENCE.** ‘Looks like your body got pretty activated.’ Or: ‘Looks like you went somewhere quiet for a minute.’ Do not ask ‘are you okay?’ — that is a question the dysregulated nervous system cannot answer.
4. **OFFER ONE GROUNDING CHOICE.** ‘Want to step into the hall with me for a minute?’ OR ‘Want to put your feet flat on the floor and breathe out slow with me for five breaths?’ The choice itself is regulation — it returns agency to the student. Whichever they pick, follow through.
5. **WAIT FOR THE BODY TO SETTLE.** Do not try to verbally process what happened. Do not ask what triggered it. Just be present and quiet while the breathing slows. The conversation, if any, comes later — not here.
6. **ASSESS.** If the student has returned to inside the Window within 2 minutes — invite them back into the room when they are ready. If they have NOT — Section 4.5 escort to counselor begins. You are not the clinician for this. You are the bridge.

SECTION 4.5 ESCORT PROTOCOL

If a student does not return to inside the Window within 2 minutes of grounding, they are escorted (not sent — escorted) to the counselor. The escort itself follows specific protocol: another adult covers the class, the teacher walks the student, the counselor has been pre-warned by intercom or phone. The student is NOT left alone in a hallway. They are NOT sent ‘to take a break’ unaccompanied. The escort itself is part of the regulation. The teacher returns to class once the handoff is complete. The lesson resumes — calmly — for the remaining students. The class will look to you for the signal that the room is still safe. Provide that signal with your own settled nervous system. Document the event in the teacher log within 24 hours. Document — do not analyze. The counselor will follow up under their own protocol.

Post-Lesson Regulation Close

U1-L1 ends with a deliberate close — not just a transition. The close exists because the lesson has done emotional work, and the body needs an explicit cue that the work is paused before students move to the next class. This is the teacher’s last task in the lesson and it takes 90 seconds.

THE 90-SECOND CLOSE

- Have students close their journals. Have them physically place a hand on top of the journal for a moment. (This is sensorimotor closure — the body marks the end of the writing.)
- Three slower exhales together, out loud counted by you: ‘one, two, three.’ Quiet. Even pace. The teacher’s exhale rate sets the room’s exhale rate.
- One simple anchoring sentence: ‘What we just did was real work. You did it well. The next class is a different room and a different topic. We will pick this up tomorrow.’
- Stand at the door as students leave. Acknowledge each by name if you can. Brief check-ins with any flagged students happen here.
- After the room is empty, sit for 60 seconds before the next class arrives. You did real work too. Your nervous system needs the same close.

WHAT THE CLOSE IS DOING

Middle schoolers in transition between classes are uniquely vulnerable to ungrounded activation. A student who has just done U1·L1 and walks directly into a noisy hallway and a different teacher’s very different tone may carry the activation forward and have a difficult next period for reasons nobody else in the building can trace. The 90-second close is the bridge that prevents that. It does not require anything elaborate. It requires the teacher to stay regulated, to give the body a closure signal, and to send students out with a settled nervous system rather than an open one.

When the Body’s Signals Contradict the Verbal Report

Middle schoolers will sometimes say one thing and their body will say another. A student who is in significant interior distress may say ‘I’m fine’ with a flat tone, slow blink, and downturned mouth. A student who has had a profound positive realization may say ‘this is stupid’ as a defense against the vulnerability of having felt something. The teacher’s task is to weight the body, gently, without confronting the words.

THREE COMMON PATTERNS IN U1·L1

PATTERN A · ‘I’M FINE’ SAID FLATLY

The student verbally reports being fine while the body signals are clearly hypoaroused or activated. The teacher’s move is NOT to challenge the verbal report. Adolescents will dig in if their words are contradicted. The move is to accept the words AND make a quiet observation about the body.

‘Okay. I just noticed you got pretty quiet during that last bit, so I wanted to check. If you want to talk to [counselor] later about anything, you can — and you don’t have to.’

PATTERN B · DEFLECTION THROUGH DISMISSAL

The student says ‘this is stupid’ or ‘I don’t get why we’re doing this’ during or after a moment when the body has clearly registered something real. This is defensive armoring — the dismissal is protecting the vulnerability of having been moved. The teacher’s move is to receive the dismissal without arguing AND leave the door open.

'Fair enough. It doesn't have to land for you. We'll keep going and you can take what's useful.'

PATTERN C · SUDDEN PHYSICAL COMPLAINT

The student reports a sudden headache, stomachache, or other physical symptom in the middle of the lesson. This is often (not always) the body offering a socially acceptable exit from emotional activation. The teacher's move is to take the complaint seriously **WITHOUT** immediately granting exit, and to offer a regulated alternative.

'Okay — let me know if it gets worse. If you need to step into the hall for two minutes that's fine. Or if you'd rather just close your journal for now and listen, that's also fine. You don't have to keep writing.'

THE PRINCIPLE UNDERNEATH ALL THREE

The body knows the body's state better than the mouth does, especially in adolescence. You weight the body. You do not contradict the words. You make space for the truth to surface later — sometimes much later, sometimes through the counselor, sometimes never visibly to you. That is okay. Your job is to be the kind of adult whose presence makes the truth surface-able. The lesson's success is not measured by how much the student told you. It is measured by whether you stayed regulated enough that they **COULD** have, if they chose.

Accommodations Matrix

U1-L1-specific accommodations for students with IEP, 504, ELL, and autism-spectrum needs. These are additive to standard IEP/504 plans — they do not replace them. Coordinate with the special education team before lesson delivery.

IEP — Anxiety / Trauma-related	Pre-lesson preview at least 24 hours in advance (with case manager). Permission to sit near door with a quiet exit signal pre-arranged. Counselor check-in scheduled within the school day FOLLOWING the lesson regardless of in-lesson presentation. Journal substitution available: voice memo to counselor in lieu of writing if writing is not accessible. Family Bridge note delivered through case manager, not directly to family, if home environment is part of the student's active concerns.
IEP — ADHD / Executive Function	Movement break built into the journal segment if needed — student can stand at their desk while writing. Reduced word count expectation for journal entry; bullet points or sketches acceptable. Verbal pre-reading of the journal prompt out loud, twice. Extended time at the end of lesson available for those who need it; do not rush close.
504 — Sensory / Medical	Lighting adjustments if photosensitive — confirm room lighting is not strobing. Headphones permitted if room noise is a barrier. Bathroom break without permission required throughout this lesson. Medical conditions affecting somatic monitoring (e.g., conditions producing flushing or rapid heart rate at baseline) noted in advance so you don't misread the baseline as activation.
ELL — Newcomer (< 2 years)	Pre-teach the lesson's core vocabulary in home language if possible (mask, mirror, perception, identity, journal, private). Visual support: a simple two-circle diagram showing 'what people see' vs. 'what is true' with no English words. Journal prompt available in home language alongside English. Drawing as full alternative to writing accepted. Partnered with a same-language peer ONLY if the peer relationship is already established and trusted — never assign a translation partner cold during a threshold lesson.
ELL — Intermediate	Sentence stems for the journal prompt available ('What I show is _____. What is true is _____. The look that came first would know _____.') — adjust if delivering the secular-only version). Permitted to write in home language and translate later if they want to. Verbal share-out is voluntary as it is for all students; the language pressure is not added.
Autism-Spectrum (verbal)	Direct, literal language in the lesson script. Pre-lesson preview of what will happen, step by step, in advance. Journal prompt offered with behavioral reframe as alternative: 'What is one thing you would do differently tomorrow if you really believed someone saw you and was for you? What is one thing you would do the same?' Justice-sensitivity may surface and is welcomed — see Autism Layer in D2 for the full pastoral note (this somatic floor document does not include the Christian framing, but the autism-spectrum considerations are identical). Special-interest reference acceptable as part of the Mirror response.
Autism-Spectrum (minimally verbal)	AAC or alternative communication method used as normal. Journal: drawing, AAC text generation, or other typical alternative. Sensory accommodations (weighted blanket if part of IEP, fidget access, lighting) maintained. Pre-lesson preview essential. Counselor consultation in advance of lesson delivery, not after — for some autistic students, the construct of 'Mask vs. Mirror' may require advance framing in the student's primary support relationship before classroom delivery is appropriate.

Disclosure Pathway · Section 4.5

U1-L1 is rated standard risk. The lesson does NOT carry an AFSP Safe Messaging trigger and is NOT designated ★ or ★★. However, threshold lessons sometimes produce first-time disclosures because they are the first time the year has opened space for them. Be ready.

DISCLOSURES TO EXPECT IN U1-L1

- 'The Mask is the only safe thing I have.' — A student naming that the public self is keeping them safe from something. Investigate gently after class; counselor referral if a specific harm is named or implied.
- Disclosure of an active home stressor (divorce, parental conflict, recent loss, financial distress) that has caused increased Mask-wearing. NOT itself a mandatory report unless the disclosure includes specific safety concerns. Counselor referral is appropriate.
- Disclosure of social media-related distress (harassment, posted images, screenshot circulation). Often the first time the student has told an adult. Counselor referral. May involve administrative or law-enforcement coordination depending on what is described.
- Disclosure of a previous adult having said something harmful about the student's 'real self' that has made the student afraid of the Mirror. Counselor referral. Document carefully — this is sometimes the first surface of a longer pattern.
- Disclosure of self-harm thoughts or actions. AFSP Safe Messaging applies. IMMEDIATE counselor handoff under Section 4.5. The lesson stops being the priority. Do not continue the journal segment with this student.

MANDATORY REPORTING TRIGGERS

All standard mandatory reporting categories apply: physical abuse, sexual abuse, neglect, suicidal ideation with plan, threats to harm others, evidence of trafficking, evidence of online sexual exploitation. If ANY of these surfaces during U1-L1, the disclosure protocol overrides everything else in this document. Section 4.5 governs. What you do: Acknowledge what the student said. Tell them honestly: 'I'm glad you told me. I have to tell [counselor / DCFS / appropriate authority] because what you said is the kind of thing I'm not allowed to keep to myself. I'm going to stay with you while we figure out what happens next.' Do not promise confidentiality you cannot give. Do not interrogate for more detail. Hand off cleanly to the counselor. Document within 24 hours. Document — do not analyze. The receiving authority does the analysis.

Compatibility Matrix

How this somatic floor document plugs into the master Book 3 architecture and into the parallel Christian companion document (D2). Read once. Then assume.

Master U1-L1 lesson	Runs as written in the Book 3 master curriculum. This document does not modify the master lesson. It governs the regulation floor underneath it.
Opening ritual (2-4 min)	Mandatory. Non-negotiable. Standard Book 3 grounding ritual. Not modified by this document.
In-lesson scan points	Specified above (5 scans: after opening, after construct, before journal, mid-journal, at close). This is the U1-L1-specific scan schedule.
Disclosure protocol	Section 4.5 of the master Book 3 document. Applies in full. This document references it but does not replace it.
AFSP Safe Messaging	Not directly triggered by U1-L1 content. Stays activated as standing protocol for any disclosure that surfaces.
PPRA pre-notification	Not required for U1-L1 specifically. Year-start parental notification covers this lesson.
Counselor coordination	Counselor available by phone (not required on-site for U1-L1). For ★★ lessons later in the year, on-site is required and this document's protocols intensify accordingly.
FERPA — journal privacy	Preserved. Student journals are Private Student Property. Teacher does not read journals. This document explicitly upholds the privacy.
Christian Companion (D2)	Parallel deliverable for schools using the Divine Blueprint track. D2 sits ALONGSIDE this somatic floor — it does not modify it and is not a substitute for it. Schools using only this document are fully covered. Schools using both deliver the master lesson, then the somatic floor (this document) governs throughout, AND the D2 extension is appended at the appropriate point.
Substitute teachers	U1-L1 does NOT run with a substitute who has not read this document. Postpone.
Pacing flexibility	Master pacing calendar allows U1-L1 to be delivered any time within a one-week window in September. Use the flexibility.

Closing Note

This somatic floor exists because U1-L1 is a threshold lesson — and threshold lessons do real work in the body whether or not the students can articulate it. The teacher who delivers U1-L1 well is not the teacher who delivers it with the most polished script. It is the teacher who has read this document, regulated their own nervous system before students arrived, kept the scan points in mind, and held space for the room without amplifying it.

Every later lesson in Book 3 rests on the floor this document establishes. Get U1-L1 right at the somatic level, and the year has a foundation. Get it wrong, and the year inherits the dysregulation forward. The investment is here.

The body keeps the score. The body also tells the truth before the mouth catches up. Listen to it. Weight it. Trust it. The students will know whether you do.

THE STANDING REMINDER

Regulation precedes cognition. A student outside the Window cannot receive the lesson. The somatic floor catches them first. Always.
